

Composting

Composting is a natural process where organic matter is broken down into a nutrient filled soil amendment. This amendment is referred to as **compost**, and should be mixed together with soil or other growing mediums.

Benefits of Adding Compost to Your Lawn or Garden

- Replenishes and stores organic matter that is rich in nutrients which will feed your plants.
- Reduces erosion and water run-off.
- Loosens hard, clay soils which will help your plants to grow stronger root systems.
- Retains more moisture in sandy soils, lessening the need for constant watering.
- Decreases or eliminates the usage of fertilizers as the compost contains multitudes of slowly released nutrients.
